

Aim: File Handling (java.io).

1. Write a java program for reading a console input (using BufferedReader class).

CODE:

```
import java.io.*;

public class ConsoleInput{
    public static void main(String args[]) throws IOException{
        BufferedReader br = new BufferedReader(new InputStreamReader(System.in));
        String s[] = new String[100];
        System.out.println("Enter the text:");
        System.out.println("Write 'stop' to stop writing!");
        for(int i=0;i<100;i++){
            s[i] = br.readLine();
            if(s[i].equals("stop")){
                break;
            }
        }
        System.out.println("\nYou have written:");
        for(int i=0;i<100;i++){
            if(s[i].equals("stop")){
                break;
            }
            System.out.println(s[i]);
        }
    }
}
```

OUTPUT:

Enter the text:

Write 'stop' to stop writing!

I was once an invincible warrior

and no one dares to stand in my way

stop

You have written:

I was once an invincible warrior

and no one dares to stand in my way

2. Write a java program to read the data from text file.

CODE:

```
import java.io.*;

public class FileRead {
    public static void main(String args[]) throws IOException{
        File f = new File("atomic.txt");
        FileReader r = null;
        BufferedReader br = null;
        try{
            r = new FileReader(f);
            br = new BufferedReader(r);
            String line;
            System.out.println("Reading from: " + f.getName() + "\n");
            while((line = br.readLine()) != null){
```

```
        System.out.println(line);
    }
    br.close();
    r.close();
}
catch(IOException e){
    System.out.println(e);
    System.exit(-1);
}
finally{
    System.out.println("Reading is completed!");
}
}
}
```

OUTPUT:

Reading from: atomic.txt

Legends never die!

Reading is completed!

3. Write a java Program to read the data from console and write it to the file.**CODE:**

```
import java.io.*;
public class ConsoleToFile{
    public static void main(String args[]) throws IOException{
        File f = new File("atomic.txt");
        BufferedReader br = new BufferedReader(new InputStreamReader(System.in));
        FileWriter writer = new FileWriter(f);
        String s;
        System.out.println("Enter the text:");
        System.out.println("To 'stop' writing!");
        try{
            for(int i=0;i<100;i++){
                s = br.readLine();
                if(s.equals("stop")){
                    break;
                }
                writer.write(s);
                writer.write(System.lineSeparator());
            }
        }
        finally{
            if(writer != null){
                writer.close();
            }
            if(br != null){
                br.close();
            }
            System.out.println("Successfully written to the atomic.txt");
        }
    }
}
```

```

}
}

```

OUTPUT:

Enter the text:

To 'stop' writing!

We create emotion

Worth sharing it :)

stop

Successfully written to the
atomic.txt

**4. Write a java program for**

reading data from one file and copy it into another file by using FileReader and FileWriter class.

CODE:

```

import java.io.*;
public class CopyFile{
    public static void main(String args[]) throws IOException{
        File f1 = new File("input.txt");
        File f2 = new File("output.txt");
        FileReader r = null;
        FileWriter w = null;
        try{
            r = new FileReader(f1);
            w = new FileWriter(f2);
            int ch;
            while((ch=r.read()) != -1){
                w.write(ch);
                System.out.print(" " + ch);
            }
            r.close();
            w.close();
        }
        catch(IOException i){
            System.out.println(i);
            System.exit(-1);
        }
        finally{
            System.out.println("\nSucessfull!, PLease check your txt files.");
        }
    }
}

```

OUTPUT:

65 116 111 109 105 99 105 116 121 13 10 67 108 111 117 100 121 95 66 111 115 115 13 10 67
108 111 117 100 121 95 65 116 111 109 13 10 77 114 46 65 116 111 109 105 99
Sucessfull!, PLease check your txt files.

5. Write a java program for reading data from one file and copy it into another file by using FileInputStream and FileOutputStream class.

CODE:

```
import java.io.*;

public class FileIOStram{
    public static void main(String args[]) throws IOException{
        File f1 = new File("reader.txt");
        File f2 = new File("displayer.txt");
        FileInputStream i = null;
        FileOutputStream o = null;
        try{
            i = new FileInputStream(f1);
            o = new FileOutputStream(f2);
            int byted;
            System.out.println("Copying bytes from: " + f1.getName() + " to " + f2.getName());
            while((byted=i.read()) != -1){
                o.write(byted);
                System.out.print(" " + byted);
            }
            i.close();
            o.close();
        }
        catch(IOException e){
            System.out.println(e);
            System.exit(-1);
        }
        finally{
            System.out.println("\nDone copying");
        }
    }
}
```

OUTPUT:

Copying bytes from: reader.txt to displayer.txt

76 101 97 114 110 105 110 103 32 74 97 107 97 114 116 97 13 10 70 105 108 101 32 72 97 110
100 108 105 110 103

Done copying

6. Write a java program that demonstrate RandomAccessFile class.**CODE:**

```
import java.io.*;

public class RandomIO{
    public static void main(String args[]) throws IOException{
        RandomAccessFile f = null;
        try{
            f = new RandomAccessFile("random.txt","rw");
            f.writeChar('A');
            f.writeInt(06);
            f.writeDouble(2.89);
            f.seek(0);
            System.out.println("Reading from random file");
            System.out.println(f.readChar());
            System.out.println(f.readInt());
            System.out.println(f.readDouble());
            f.seek(2);
            System.out.println("Reading the 2nd item in a file");
            System.out.println(f.readInt());
            f.seek(f.length());
            f.writeBoolean(false);
            f.seek(4);
            System.out.println("Reading the 4th item in a file");
            System.out.println(f.readBoolean());
            f.seek(f.length());
            f.writeBytes("Hacker");
            f.close();
        }
        catch(IOException i){
            System.out.println(i);
        }
    }
}
```

OUTPUT:

```
Reading from random file
A
6
2.89
Reading the 2nd item in a file
6
Reading the 4th item in a file
false
```
